

Professional Summary

- Around **8 years of experience in full-stack application development**, contributing to enterprise projects across **Banking, Financial Services, Healthcare, HR & Payroll**, covering the complete Software Development Life Cycle from requirements through production support.
- Extensive experience working across **frontend and backend development**, building responsive user interfaces, reusable application components, business services, APIs, microservices, database integrations, and secure enterprise workflows.
- Hands-on experience with **cloud-based application development and deployment**, including containerized applications, scalable cloud environments, CI/CD processes, application monitoring, logging, and production troubleshooting.
- Strong experience in **application quality and testing**, including unit, API, integration, functional, regression, database, and end-to-end testing to ensure reliable and high-quality enterprise applications.
- Exposure to **AI-enabled application development and intelligent automation**, including integrating AI-driven capabilities into business applications and supporting data-driven features, workflow automation, and intelligent user experiences.

Technical skills

Programming Languages: Java, JavaScript, TypeScript, SQL

Frontend: ReactJS, Redux Toolkit, React Hooks, React Router, React Hook Form, Zod, Material UI, Bootstrap, HTML5, CSS3, Axios, Recharts.

Backend & APIs: Spring Boot, Spring MVC, Spring Security, Spring Data JPA, Hibernate, Node.js, Express.js, Microservices, RESTful APIs, JAX-RS, SOAP, Event-Driven Architecture, Apache Kafka, AWS SQS, AWS SNS.

AI/ML: Machine Learning, Supervised & Unsupervised Learning, Scikit-learn, TensorFlow, PyTorch, NLP, Generative AI, LLMs, Prompt Engineering, RAG, Embeddings, Vector Databases, AI/ML Model Integration, Model Deployment, MLOps

Databases & Persistence: Oracle, PostgreSQL, MySQL, MongoDB, Cassandra, PL/SQL, JDBC, HQL, Prisma ORM.

Cloud & DevOps: AWS (EKS, ECS, EC2, S3, RDS, Lambda, API Gateway, IAM, CloudWatch, SQS, SNS), Azure DevOps, Azure App Service, Azure Blob Storage, Azure Database for PostgreSQL, Docker, Kubernetes, Jenkins, Maven, Gradle, Git, GitHub, SonarQube, AWS CodePipeline, CodeBuild, CodeDeploy, CI/CD.

Security & Testing: Spring Security, JWT Authentication, Role-Based Access Control (RBAC), IAM, JUnit, Jest, React Testing Library, Postman, Functional Testing, Integration Testing, Regression Testing, API Testing, End-to-End Testing.

Tools & Practices: IntelliJ IDEA, JIRA, Linux, Splunk, Log4j, SLF4J, Agile/Scrum, TDD, Design Patterns, SDLC.

Professional Experience:

Client: Western Union, Austin, TX

Aug 2024 - present

Role: Sr. Full Stack Developer

Responsibilities

- Built responsive customer and employee interfaces using **React.js, TypeScript, HTML5, CSS3, and Material UI** for money-transfer initiation, transaction review, and status tracking across desktop and mobile devices.
- Created reusable **React.js** components for transfer forms, recipient lists, transaction tables, confirmation screens, status indicators, alerts, and notification panels, keeping customer and support workflows consistent.
- Structured a multi-step remittance workflow covering sender information, recipient details, transfer amount, payout method, transaction review, and submission.
- Applied **React Hook Form and Zod** to validate recipient information, required transfer fields, and transaction inputs, displaying field-level feedback before customers submitted requests.
- Presented exchange rates, transfer fees, and estimated recipient amounts within the customer interface, allowing users to review the transaction details before confirming a transfer.
- Equipped support staff with a transaction dashboard featuring search, filtering, sorting, pagination, transfer-status tracking, and access to customer and recipient details.
- Used **Redux Toolkit, Axios, and Recharts** for shared transfer state, **REST API** integration, and visual reporting on transaction volume, status trends, and outcomes.
- Implemented backend services with **Node.js and Express.js** to support recipient management, money-transfer requests, transaction tracking, and employee review functions.

- Designed **REST API** endpoints for customers, recipients, transfers, transaction statuses, notifications, and authentication, connecting customer-facing screens with backend services.
- Modeled customer profiles, recipient records, transaction details, and status history in **PostgreSQL** using **Prisma ORM** for application data access.
- Secured customer accounts and employee functions through **JWT-based authentication and role-based authorization**, restricting transaction information and operational actions by user role.
- Integrated **Apache Kafka** to publish events for transfer submissions and status changes, allowing related services to process updates asynchronously.
- Created **Kafka producers and consumers** for transaction events, reducing direct dependencies between transfer processing and downstream notification functions.
- Connected **Kafka-based notification processing** to transaction-status events so customers could receive updates when transfer information changed.
- Supported application builds and releases using **Git, GitHub, Azure DevOps, Docker, Azure App Service, Azure Blob Storage, and Azure Database for PostgreSQL**.
- Added server-side checks and consistent error responses in **Express.js** for incomplete transfer requests, invalid inputs, and unsuccessful transaction operations.
- Tested transfer forms, validation rules, reusable components, and customer interactions with **Jest and React Testing Library**.
- Verified **REST APIs**, authentication, transaction-status updates, event-driven flows, and frontend–backend integration through **Postman**, integration, and regression testing

Client: Legacy Health, Portland, OR

Role: Full Stack Developer

Sep 2022 - July 2024

Responsibilities:

- Translated patient, provider, and administrator requirements into **ReactJS** dashboards displaying appointments, clinical schedules, patient queues, and healthcare operational measures.
- Created reusable **ReactJS** components for patient registration, provider profiles, appointment forms, schedule views, and dashboard panels, maintaining consistent behavior across healthcare workflows.
- Designed appointment-booking screens that allowed patients to search for providers, review available consultation slots, enter visit details, and confirm a booking.
- Implemented cancellation and rescheduling interfaces that displayed updated appointment information to patients and reflected schedule changes in provider views.
- Organized daily clinical activity through provider schedule and patient queue screens showing upcoming visits, appointment status, and consultation progress.
- Presented patient volume, appointment trends, cancellations, provider workload, and waiting-time measures in administrative dashboards for operational review.
- Connected patient, provider, and administrator screens to **RESTful APIs**, handling unavailable time slots, invalid entries, and unsuccessful requests within the interface.
- Implemented backend services using **Java, Spring Boot, and Spring MVC** for patient management, provider schedules, appointments, billing events, and notifications.
- Defined **RESTful API** endpoints for appointment booking, schedule updates, patient information, and dashboard data consumed by the different user interfaces.
- Applied scheduling rules in **Spring Boot** to check provider availability and process appointment changes before updated slots were shown to patients.
- Used **Spring Data MongoDB and MongoDB** for semi-structured application records and **Cassandra** for high-volume healthcare events, where those data stores were part of the project.
- Published and consumed **Apache Kafka** events for appointment confirmations, cancellations, provider schedule changes, billing activity, and patient notifications.
- Configured **Apache Camel** routes to transform and route patient, appointment, and billing information exchanged with external healthcare systems.
- Aggregated appointment counts, cancellation patterns, waiting times, and provider utilization in **Java** services for healthcare operations dashboards.
- Integrated **Amazon S3** for storing and retrieving patient documents and medical reports associated with application workflows, where applicable.
- Packaged **Spring Boot** services with **Docker** and used **Gradle, Git, and SonarQube** for builds, version control, and code-quality checks.
- Wrote **JUnit** tests for appointment rules, service responses, data access, and **Apache Kafka** processing to verify behavior across connected healthcare functions.

- Used **Splunk** to review application logs and investigate scheduling errors, service failures, and other issues affecting healthcare workflows.

Client: Adidas - Portland, OR

Nov 2020 - Aug 2022

Role: Software Developer

Responsibilities:

Responsibilities:

- Shaped the e-commerce storefront using **React JS, JavaScript, HTML5, and CSS3**, creating responsive experiences for product discovery, item details, shopping carts, and checkout.
- Created reusable **React JS** components for product cards, size and color options, merchandise filters, promotional content, and customer account navigation.
- Implemented search and category navigation that allowed shoppers to narrow product listings and inspect merchandise before selecting an item.
- Presented product descriptions, pricing, available options, and stock information in item-detail views connected to backend **RESTful APIs**.
- Managed cart interactions in **React JS**, allowing customers to update selected items and quantities while reviewing order details before checkout.
- Applied **JavaScript** form validation to customer and checkout information, displaying clear feedback when required order details were missing or invalid.
- Built customer account views for purchase history and order tracking, retrieving current order information through **RESTful APIs**.
- Implemented catalog, cart, customer account, and order services using **Java, Spring Boot, and Spring MVC** to support storefront operations.
- Used **Spring Data JPA and Hibernate** to retrieve and maintain product, customer, cart, and order records needed throughout the shopping journey.
- Applied backend business rules in **Java** to validate cart changes and order requests before creating or updating purchase records.
- Published and consumed **Apache Kafka** events for order placement, inventory changes, and fulfillment updates where these asynchronous integrations existed.
- Protected customer account information and order endpoints using **Spring Security** authentication and authorization controls.
- Packaged **Spring Boot** services with **Docker** and supported deployment and monitoring of ecommerce components in **AWS** environments.
- Wrote **JUnit** tests and performed **REST API**, integration, and regression testing across product discovery, cart updates, checkout, and order-status workflows.

Client: Citrix Systems, Hyderabad, India

July 2018 - Oct 2020

Role: Software Developer

Responsibilities

- Created enterprise administration interfaces using **ReactJS, JavaScript, HTML5, CSS3, and Bootstrap** for reviewing application records and managing configuration settings.
- Built reusable **ReactJS** components for configuration forms, searchable tables, navigation, status indicators, and feedback messages across management screens.
- Implemented record-search and detail views that helped administrators locate application information and review existing settings before making changes.
- Applied **JavaScript** validation to configuration forms, identifying missing or invalid entries and displaying feedback before updates were submitted.
- Integrated administrative interfaces with **REST APIs** to retrieve records, submit configuration changes, and display the outcome of each request.
- Implemented backend functions with **Java, Spring Boot, and Spring MVC** to process administrative requests and coordinate application data updates.
- Added server-side input validation and exception handling in **Spring Boot** services to prevent invalid configuration changes from being persisted.

- Enforced role-based authorization so administrative functions and sensitive application settings were available only to permitted users.
- Used **Spring Data JPA, Hibernate, JDBC, and Oracle** to retrieve, update, and maintain records used by enterprise application workflows.
- Wrote **Oracle SQL and PL/SQL** queries and routines for data processing, validation, and reporting were required by the application.
- Investigated inconsistencies between **REST API** responses and **Oracle** records, tracing defects through service and data-access layers.
- Automated builds, tests, packaging, and deployment steps using **Maven, Jenkins, and Git** across application environments.
- Packaged **Spring Boot** services with **Docker** to provide consistent environments for development, testing, and release activities.
- Used **JUnit and Postman** to test service logic and administrative **REST APIs**, then completed defect retesting and regression checks before releases.

Education:

Master's in Computer Science, Florida Atlantic University, Boca Raton, Florida

Bachelor's in Computer Science, Vignana Bharathi Institute of Technology, Hyderabad, India
